Listing first 45 summaries Searched: Scoring table: Perfect score: Sequence: Maximum DB seq length: 0 Title: Run on: OM protein - protein search, using sw model number of hits satisfying chosen parameters: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. 1026.5 1017.5 1014.5 1013 1013 195 974 787.5 766.5 Query Match 100.0 50 PIR_68:* BLOSUM62 Gapop 10.0 , Gapext 0.5 September 6, 2001, 10:53:40 ; Search time 16.05 Seconds (without alignments) 1775.033 Million cell updates/sec 219241 segs, 76174552 residues US-08-878-801-2 1960 GenCore version 4.5 Copyright (c) 1993 - 2000 Compugen Ltd. ```

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

845699
GTP-binding regulatory protein alpha chain q - African clawed frog
GTP-binding regulatory protein alpha chain q - African clawed frog
N.Alternate names: G-alpha q protein
C.Species: Xenopus lacvis (African clawed frog)
R.Shapira, H.; Way, J.; Lipinsky, D.; Oron, Y.; Battey, J.F.
R.Shapira, H.; Way, J.; Lipinsky, D.; Oron, Y.; Battey, J.F.
A.Title: Neuromedin B receptor, expressed in Xenopus lacvis occytes, selectively couples
A.Title: Neuromedin B receptor, expressed in Xenopus lacvis occytes, selectively couples
A.Accession: S45699
A.Aolecule type: mRNA
A.Residues: 1-359 ASHA
A.Residues: 1-359 ASHA
A.Residues: GB:U10502; NID:9505689; PIDN:AAA52189.1; PID:9505690
C.Superfamily: GTP-binding regulatory protein Gs alpha chain
C.Keywords: GTP binding; nucleotide binding; P-loop; signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Cross-references: GB:M55412; NID:g193501; PIDN:AAA63306.1; PID:g193502
C; Comment: The G proteins are a family of guanine nucleotide-binding proteins that relay ains. The beta and gamma chains, required for GTPase activity, appear to be common to all arase; it is specific for each type of G protein.

C:Comment: The G proteins are a family of quanine nucleotide-binding proteins that
ains. The beta and gamma chains, required for GTPase activity, appear to be common
rase; it is specific for each type of G protein.

A.Rocession
rase; it is specific for each type of G protein.
C.Superfamily: GTP-binding regulatory protein Gs alpha chain
C.Steywords: GTP binding; heterotrimer; nucleotide binding; P-loop; signal transduction
F.46-53/Region: nucleotide-binding motif A (P-loop)
F.274-277/Region: GTP-binding NKXD motif
F.52/Binding site: GTP (Lys) #status predicted
F.183/Modified site: ADP-ribosylarginine (Arg) (by cholera toxin) #status predicted

The invention relates to G-protein fusion receptors (I) comprising:

(C) in the N to C direction, extracellular (ECD), transmembrane (TMD) and calculur receptor).

(C) intracellular (ICD) domains, each chosen independently from a CaR calculur receptor), GluR (metabotropic glutamate receptor) and GABABR (Gamer aminobutyric acid receptor); (2) an optional linker attached to Inker. (I), and recombinant chimeric receptors or the Component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are sasociated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischeenia, hypoglycaemia, anoxia, conspinal cord injury, epilepsy, ischeenia, hypoglycaemia, anoxia, conspinal cord injury, epilepsy, ischeenia, hypoglycaemia, anoxia, conspinant production of corresponding proteins; and cord insering the cord injury, epilepsy, ischeenia, hypoglycaemia, anoxia, conspinant production of corresponding proteins; and cord injury, epilepsy, ischeenia, hypoglycaemia (I) is used:

(1) for recombinant production of corresponding proteins; and conspinant production of corresponding proteins; and conspinant allows presentation of GABABR domains, to a binding agent, in a incomplete receptors, lacking one or more domains. By shuffing different ceneptor.
New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                             Claim 32; Fig 4; 255pp; English.

AAY99841 standard; Protein; 374 AA. (first entry) Human G-alpha-16 protein. 08-SEP-2000 AAY99841;

361 DSVLARYLDEINLL 374

```
The present sequence is the human G-protein G-alpha-16. G-alpha-16 thieracts differentially with several receptor types including members of the opioid and chemokine receptor families. Antisense oligonucleotides that target the nuclectide sequence encoding the present protein can be used to modulate the expression of G-alpha-16. They may be used to inhibit the expression of G-alpha-16 in human cells and tissues and thus diseases associated with G-alpha-16, such as hyperproliferative formation can be prevented or delayed The compounds can be prevented or delayed The compounds can be used in research and diagnostics in sindwich and other assays.
                   Human; G-alpha-16; G protein; cytostatic; hyperproliferative disorder;
cancer; inflammation; infection; antisense inhibition.
                                                                                                                                                                                                                                                                                                                                              A new antisense compound for inhibiting the expression of human G-alpha-16 and treating, preventing or delaying infections, inflammation or hyperproliferative disorders such as cancer -
                                                                                                                                                                                                                                                                                                                                                                                                              Example 10; Page 82-84; 100pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein comprises murine G-alpha 16 protein, a promiscuous G-protein whose subunits allow coupling with G-protein coupled creeptors (GPCRS) that normally couple with G-proteins of other feedpots (GPCRS) that normally couple with G-proteins of other families. Stable isolated cells are claimed that include a construct comprising an inducible promoter linked to a nucleic acid encoding a promiscuous G-alpha protein. A murine G-alpha 16 protein polynucleotide (see AAV03464) or a human G-alpha 15 protein polynucleotide (see AAV03465) is preferably used. The cells protein polynucleotide (see AAV03465) is preferably used. The cells cany also comprise a second construct in which a reporter gene is linked to a second promoter that is medulated by a promiscuous G-alpha protein. The cells are used in novel methods for identifying a GPCR for a given ligand, or vice versa, or modulators of signal transduction in a cell and for classifying ligands as agonists or antagonists. Since live cells are used, any identified receptor or ligand be cloned, and use of fluorescent detection permits characterisation of individual cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 QMRIIHGAGYSEEERKGFRPLVYQNIFVSMRAMIEAMERLQIPFSRPESKHHASLVMSQD 120

```
The present sequence represents a rabbit G-protein alpha 16 polypeptide. The polypeptide is believed to be a member of the GTP-binding regulatory protein family. The polypeptide is a regulator of signal transduction. The polypeptide is useful for treating an individual in need of enhanced activity or expression of G-protein alpha 16. Antagonists are useful for treating an individual in need to inhibit the activity or expression of G-protein alpha 16. The polypeptide is also useful as an immunogen to produce antibodies and for producing immunological response in mammals. The G-protein alpha 16 polypeptides and polynucleotides are useful in screening for antagonists and agonists of G-coupled protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to G-protein fusion receptors (I) comprising:
(1) in the N to C direction, extracellular (EGD), transmembrane (TMD) aintracellular (ICD) domains, each chosen independently from a CaR (Calcium receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease

linker. (I), and recombinant chimeric receptors (CR) without the GP component, are used to assess function of the various domains and to identify compounds (e.g. allosteric medulators or antagonists) that act on these domains. The medulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, Alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABAER domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This protein comprises human G-alpha 15 protein, a promiscuous G-protein whose subunits allow coupling with G-protein coupled receptors (GPCRs) that normally couple with G-proteins of other families. Stable isolated cells are claimed that include a construct comprising an inducible promoter linked to a nucleic acid encoding a promiscuous G-alpha protein. A human G-alpha 15 protein polynucleotide (see also AAV03465) or a mouse G-alpha 16 protein polynucleotide (see also AAV03465) or a mouse G-alpha 16 protein may also comprise a second construct in which a reporter gene is linked to a second prometer that is modulated by a promiscuous G-alpha protein. The cells are used in novel methods for
                                                                                                                                                   Stable cells containing sequence encoding promiscuous G-alpha protein - useful to identify G-protein coupled receptors or ligands, and agonists or antagonists of signal transduction in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                           identifying a GPCR for a given ligand, or vice versa, or modulators of signal transduction in a cell and for classifying ligands as agonists or antagonists. Since live cells are used, any identified receptor or ligand can be cloned, and use of fluorescent detection permits characterisation of individual cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The invention relates to G-protein lustical freedburs (1) compiles in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaR (calcium receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the C-terminus of ICD; and recombinant chimeric receptors (CR) without the GP component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischemia, hypodycaemia, anoxia, alsoration of appression. Nucleic acid (II) that encodes (I) is used: (1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR comminant allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of a normal comminant domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EERKGFRPLVYQNIFVSMRAMIEAMERLQIPFSRPESKHHASLVMSQDPYKVTTFEKRYA 132

The invention relates to G-protein fusion receptors (I) comprising:
(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaR (calcium receptor). Glux (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the linker. (I), and recombinant chimeric receptors (CR) without the GP component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or
                      New G-protein fusion receptors and chimeras containing domains from
different receptors, used to screen for modulators, potentially useful
e.g. for treathing or preventing stroke or Alzheimer's disease

spinal cord injury, epilepsy, ischaenia, hypoglycaemia, anoxia, Alzheimer's disease, hyperparathyrolilism, osteoprorosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and maluk domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1045 clseeakearrindeierglrrdkrdarrel allligtgesgkstfikgmriihgsgysd 1104

defaulty compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                        The invention relates to G-protein fusion receptors (I) comprising:
(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaR (calcium receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the linker. (I), and recombinant chimeric receptors (CR) without the GP component, are used to assess function of the various domains and to
                                                                                                                                                                                              New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease

The invention relates to G-protein fusion receptors (I) comprising:

(I) in the N to C direction, extracellular (ECD), transmembrane (TMD) and

(I) in the N to C direction, extracellular (ECD), transmembrane (TMD) and

(I) the Intercellular (ICD) domains, each chosen independently from a CRR

(Calcium receptor), Glux (metabotropic glutamate receptor) and GABABR

(Calcium receptor), Glux (metabotropic) glutamate receptor) and GABABR

(Calcium receptor), Glux (metabotropic)

(Component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to receptors are potentially useful for treating or no these domains. The modulators are potentially useful for treating or private the properparathyroidism, osteoprosis, cognitive

(I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR

(I) for recombinant production of corresponding proteins; and (2) to commains allows presentation of GABABR domains, to a binding agent, in a domains allows presentation of GABABR domains, by shuffling different incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13 CLTEDEKAAARVDQEINRILLEQKKQDRGELKLLLLGPGESGKSTFIKQMRIHGAGYSE 72

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
```

Sequence 1397 AA;

```
The invention relates to G-protein fusion receptors (I) comprising:
(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and
intracellular (ICD) domains, each chosen independently from a CaR
(calclum receptor), GluR (metabotropic gultamate receptor) and GABABR
(gamma-aminobutyric acid receptor); (2) an optional linker attached to
the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the
                                                                                                     73 EERKGFRPLVYQNIFVSMRAMIEAMERLQIPFSRPESKHHASLVMSQDPYKVTTFEKRYA 132

linker. (I), and recombinant chimeri: receptors (CR) without the GP component, are used to assess function of the various domains and to on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or sprand cord injury, epilepsy ischaemia, hypoglycaemia, anoxia, discreters and depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and molius allows presentation of GABABE: domains, to a binding agent, in a incomplete receptors, lacking one or more domains, to a binding agent, in a incomplete receptors, lacking one or more domains. By shuffiling different receptor, agents can be identified that affect particular domains of a

The invention relates to G-protein fusion receptors (I) comprising:

(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CAR (acticum receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-ferminus of ICD; and (3) a G-protein (GP) linker attached to component, are used to assess function of the various domains and to dentify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, allowing proteins; and depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and modulators and allows presentation of GABABR domains, to a binding agent, in a commine allows presentation of GABABR domains, to a binding agent, in a commine, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   m

```
the expression of a target nucleic acid (tNA) sequence via binding of the expression of a target nucleic acid (tNA) sequence via binding of the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bloactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAX52701 to AAX41220, and AAX52701 to Expresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity

The present invention describes inhibitory antisense compounds of 8-30 nucleotides, targeted to a nucleic acid molecule encoding human G-alpha-11. The present sequence represents human G-alpha-11. AA219468 to AA219547 represent human G-alpha-11 phosphorothicate antisense oligonucleotides given in the present invention. The oligonucleotides may be useful for the treatment of diseases associated with G-alpha-11.

The invention relates to G-protein fusion receptors (I) comprising:

CC (1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and continue interacellular (ICD) domains, each chosen independently from a CaR intracellular (ICD) domains, each chosen independently from a CaR intracellular (ICD) domains, each chosen independently from a CaR continue (GluR (metabotropic glutamate receptor) and Gababr (C (gamma-mainobutyric acid receptor); (2) an optional linker attached to CC (gamma-mainobutyric acid receptor); (2) an optional linker attached to CC (TMD) and recombinant chimeric receptors (CR) without the GP (C C Componnet, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to continue the General CC (C) on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinely cord injury, epilepsy, ischemia, hypoglycaemia, anoxia, continue depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to commiss allows presentation of Gababr Gomains, to a binding agent, in a form more like the natural domain structure compared with use of commiss, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         313 LDMYTRMYTGCVDGPEGSKKGARSRRLFSHYTCATDTQNIRKVFKDVRDSVLARYLDEIN 372
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               193 NEYCESVQKTULRIVDVGGQKSERKKWIHCFENVIALIYLASLSEYDQCLEENNQENRMK 252

--- SUBDMIT: G PROTEINS ARE COMPOSED OF 3 UNITS (ALPHA, BETA & GAMMA).

THE ALPHA CHAIN CONTAINS THE GUANINE NUCLEOTIDE BINDING SITE.

--- TISSUE SPECIFICITY: SPECIFICALLY EXPRESSED IN HEMATOPOIETIC CELLS.

--- SIMILARITY: BELONGS TO THE G-ALPHA FAMILY. SUBFAMILY 3 (G(Q)).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lamerdin J.E., McCready P.M., Skowronski E., Adamson A.W.,

-! FUNCTION: GOANINE NUCLEOTIDE-BINDING PROTEINS (G PROTEINS) ARE
-! FUNCTION: GOANINE NUCLEOTIDE-BINDING PROTEINS (G PROTEINS) ARE
-! INVOLVED AS MODULATORS OR TRANSDUCERS IN VARIOUS TRANSMEMBRANE
SIGNALING SYSTEMS. ACTS AS AN ACTIVATOR OF PHOSPHOLIPASE C.
-! SHOUNTY: G PROTEINS ARE COMPOSED OF 3 UNITS (ALPHA, BETA & GAMMA).

THE ALPHA CHAIN CONTAINS THE GUANINE NUCLEOTIDE BINDING SITE.
-! SIMILARITY: BELONGS TO THE G-ALPHA FAMILY. SUBFAMILY 3 (G(Q)).
